

Average share of working rounds

On screen Off screen

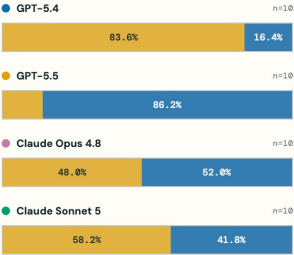

Overall

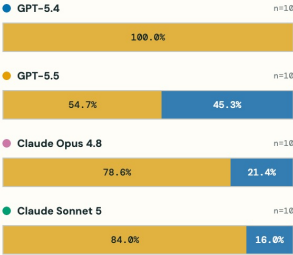

Low-level

Compound

High-level

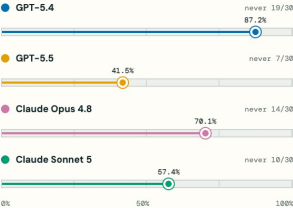

Each trace is first normalized to 100% across its GUI and off-screen working rounds. Answer-only traces with no working actions count as 100% visible by convention. The chart then averages those trace-level shares within each model and task type, giving every trace equal weight.

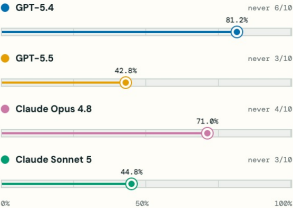

How quickly off-screen work begins

0% · Faster 100% · Slower or never

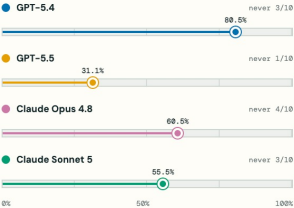

Overall

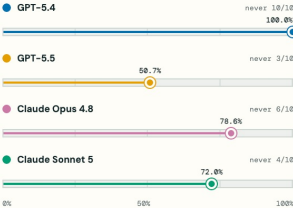

Low-level

Compound

High-level

The chart plots switch latency: first off-screen round divided by all rounds. Lower values mean a faster switch; traces that never go off screen receive 100%. Each trace contributes equal weight to the model average.
